

## Create a client action

A client action triggers an action that is entirely implemented in the client side. One of the benefits of using a client action is the ability to create highly customized interfaces with ease. A client action is typically defined by an OWL component; we can also use the web framework and use services, core components, hooks,...

1. Create the **client action**, don't forget to make it accessible.

```
<record model="ir.actions.client" id="my_client_action">
  <field name="name">My Client Action</field>
  <field name="tag">my_module.MyClientAction</field>
</record>
```

2. Create a component that represents the client action.

*my\_client\_action.js*

```
import { registry } from "@web/core/registry";

import { Component } from "@odoo/owl";

class MyClientAction extends Component {
  static template = "my_module.clientaction";
}

// remember the tag name we put in the first step
registry.category("actions").add("my_module.MyClientAction",
```

*my\_client\_action.xml*

```
<?xml version="1.0" encoding="UTF-8" ?>
<templates xml:space="preserve">
  <t t-name="awesome_tshirt.clientaction">
    Hello world
  </t>
</templates>
```
