

Animations

Odoo uses eye-catching animations that can bring your website to life. By default, we can use three kinds of animations:

- Animations on appearance
- Animations on scroll
- Animations on hover

On appearance

In standard, you can add animations to column, text and image elements when they appear, thanks to the Website Builder. Odoo detects when your element is in the viewport and launches the animation. A large selection of animations is available:

- Fade in
- Bounce in
- Rotate in
- Zoom in
- ...

You can easily define an animation on a column in your custom theme. You need to add two classes: `o_animate` and `o_anim_fade_in`. The second class changes depending on the type of animation you want to use.

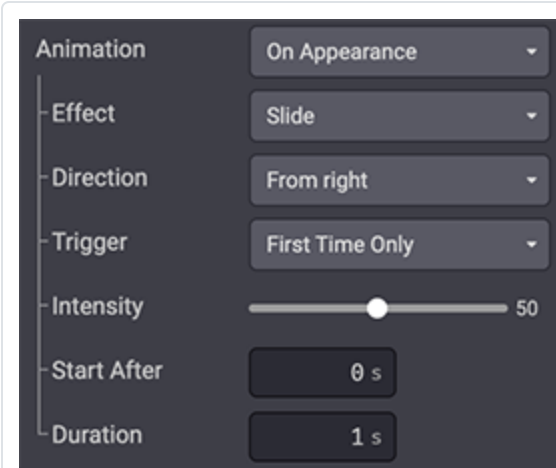

Add the `o_animate_both_scroll` class to launch the animation every time the column appears on the screen. The animation is only launched once by default.

You should also define an `animation-duration` and an `animation-delay` directly in the `style` attribute.

Additionally, you can add an animation direction. For instance, to animate the element from the bottom of the screen, add a `o_anim_from_bottom` class and set a `--wanim-intensity` in the `style` attribute to control the animation's direction intensity.

Use

```
<h2>A Section Subtitle</h2>
<p>Write one or two paragraphs describing your product or services.</p>
</div>
```

On scroll

In the same way as we have seen above, you can add animations on scroll to column, text and image elements whenever the viewport scrolls through the animated element.

We can add 6 animation on scroll effects:

- Fade
- Slide
- Bounce
- Rotate
- Zoom Out
- Zoom In

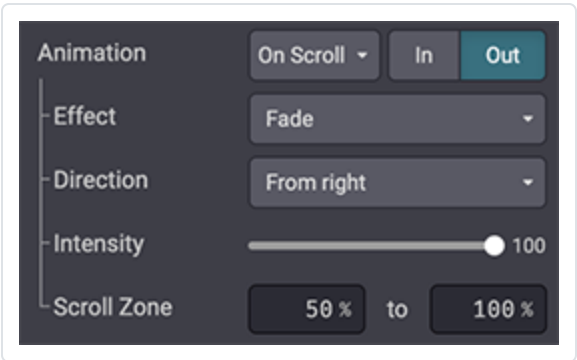

Additionally, we can also set an `in` or `out` effect, an animation `direction`, the animation intensity and a `scroll zone`.

Use

```
<div
  class="col-lg-6 o_animate o_animate_on_scroll o_animate_out o_anim_fade_in o_anim
  data-scroll-zone-start="50"
```

</div>

Option	Data attribute	Value type
Intensity	--wanim-intensity	Integer (in the CSS)
Scroll Zone Start	data-scroll-zone-start	Integer
Scroll Zone End	data-scroll-zone-end	Integer

Website Animate

On hover

This third kind of animations is only related to images and triggered every time we hover on the animated image.

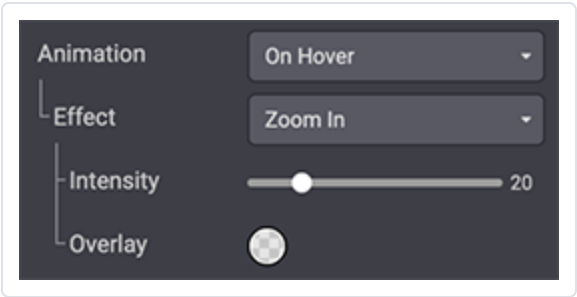

We can add 6 animation on hover effects:

- Overlay
- Zoom In
- Zoom Out
- Dolly Zoom
- Outline
- Mirror Blur

```

```

Option	Data attribute	Value type
Animation	data-hover-effect	String
Intensity	data-hover-effect-intensity	Integer
Overlay / Stroke color	data-hover-effect-color	Hexadecimal or RGBA value
Stroke width	data-hover-stroke-width	Integer (saved as px)
