

Going live

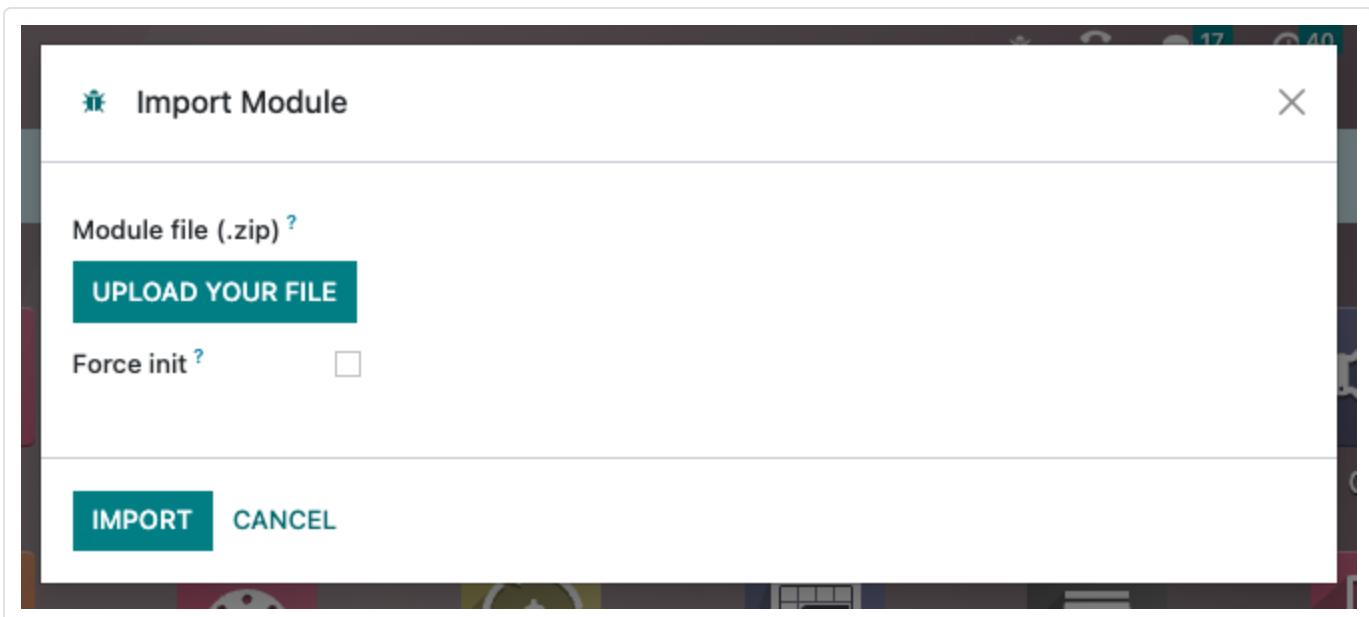

Once all the web design and development work finished, it's time to deploy it on a development or production database.

Module import

Odoo SaaS

Follow these steps the first time you import a module:

1. Create a ZIP file of your module.
2. Connect to the project database.
3. Enable the **developer mode**.
4. Go to **Apps**, search for `base_import_module`, and install it if necessary.
5. Click on **Import Module** in the menu.
6. Upload your ZIP file, tick **Force init**, and click the **Import App** button.

If you need to re-import a module after making some changes, follow the same steps, but before importing the module, open the developer menu and select **Become Superuser**. To leave the Superuser mode, log out and log back in.

What's next?

After importing and installing the module and before going live, make sure to check the SEO and redirects as well as your domain name.
