

Media

In this chapter we will see how to include media elements such as images, videos or icons within Odoo.

Images

Record images in the database and use them later in your design/code. They will also be available for the end user through the *media dialog*.

The Website Builder supports the following image file formats: JPG, GIF, PNG, and SVG.

Warning

Some options offered by the Website Builder are only applicable to media registered into a record. You might not see some options if you add an image directly with a relative path to

To use your images in your code and have them included in the builder's gallery (so the client can reuse them), declare them like this:

```
/website_airproof/data/images.xml
```

```
<record id="img_about_01" model="ir.attachment">
  <field name="name">About Image 01</field>
  <field name="datas" type="base64" file="website_airproof.
  <field name="res_model">ir.ui.view</field>
  <field name="public" eval="True" />
</record>
```

Field	Description
id	The name of your image to be used in your code
name	A descriptive name for your image
datas	The location of your image

Use

Regular images

In your xml templates, call your images as follows:

```

```

Being `img_about_01` the id you gave to your image.

Background images

```
<section style="background-image: url('/web/image/website_airproof.img_about_01');";
  <!-- Content -->
</section>
```

```
<t t-call="website.placeholder_header_brand"> .
```

```
/website_airproof/data/images.xml
```

```
<record id="website.default_website" model="website">
  <field name="logo" type="base64" file="website_airproof/:"
</record>
```

Note

Here you can find more information about the company logo setup and global website settings presets.

Tip

To make sure that your images don't slow down your web page and don't weigh too much, try to respect these few points:

- **Weight:** < 200Kb.
- **Size:** not more than 1500px if not needed.
- **Extension:** use svg or jpg, png or gif.
- **Name:** no spaces, accents or special characters and separate words with dashes. Use relevant words whenever possible.
- Images larger than 1920px will be heavily compressed by the website builder. If < 1920px, they will remain intact.

Videos

Add videos as background.

```
<section class="o_background_video" data-bg-video-src="...">
  <!-- Content -->
</section>
```

src

Add videos as content.

```

<div class="media_iframe_video" data-oe-expression="...">
  <div class="css_editable_mode_display" />
  <div class="media_iframe_video_size" contenteditable="false" />
  <iframe
    src="..."
    frameborder="0"
    contenteditable="false"
    allowfullscreen="allowfullscreen" />
</div>

```

Attribute	Description
data-oe-expression	Video URL.
src	Video URL.

Icons

By default, the Font Awesome icons library is included in the Website Builder. You can place icons anywhere using the CSS Prefix `fa` and the icon's name. Font Awesome is designed to be used with inline elements. You can use `<i>` tag for brevity, but using a `<span>` is more semantically correct.

```

<span class="fa fa-picture-o" />

```

[Font Awesome v4 icons](#)

Enable the Website Builder style options.

Increase the icon size (fa-2x, fa-3x, fa-4x, or fa-5x classes).

```
<span class="fa fa-2x fa-picture-o" />
```
