

Payment Method

`class` `odoo.addons.payment.models.payment_method.PaymentMethod` [\[source\]](#)

`_get_compatible_payment_methods(provider_ids, partner_id, currency_id=None, force_tokenization=False, is_express_checkout=False, report=None, **kwargs)` [\[source\]](#)

Search and return the payment methods matching the compatibility criteria.

The compatibility criteria are that payment methods must: be supported by at least one of the providers; support the country of the partner if it exists; be primary payment methods (not a brand). If provided, the optional keyword arguments further refine the criteria.

Parameters:

provider_ids ([list](#)) – The list of providers by which the payment methods must be at least partially supported to be considered compatible, as a list of `payment.provider ids`.

partner_id ([int](#)) – The partner making the payment, as a `res.partner id`.

currency_id ([int](#)) – The payment currency, if known beforehand, as a `res.currency id`.

force_tokenization ([bool](#)) – Whether only payment methods supporting tokenization can be matched.

is_express_checkout ([bool](#)) – Whether the payment is made through express checkout.

report ([dict](#)) – The report in which each provider's availability status and reason must be logged.

kwargs ([dict](#)) – Optional data. This parameter is not used here.

Returns:

The compatible payment methods.

Return type:

`payment.method`

`_get_from_code(code, mapping=None)` [\[source\]](#)

Get the payment method corresponding to the given provider-specific code.

If a mapping is given, the search uses the generic payment method code that corresponds to the given provider-specific code.

Parameters:

code ([str](#)) – The provider-specific code of the payment method to get.

Return type:
payment.method
