

Build a website theme

For this project, we'll collaborate on creating a custom website theme fully integrated with Odoo.

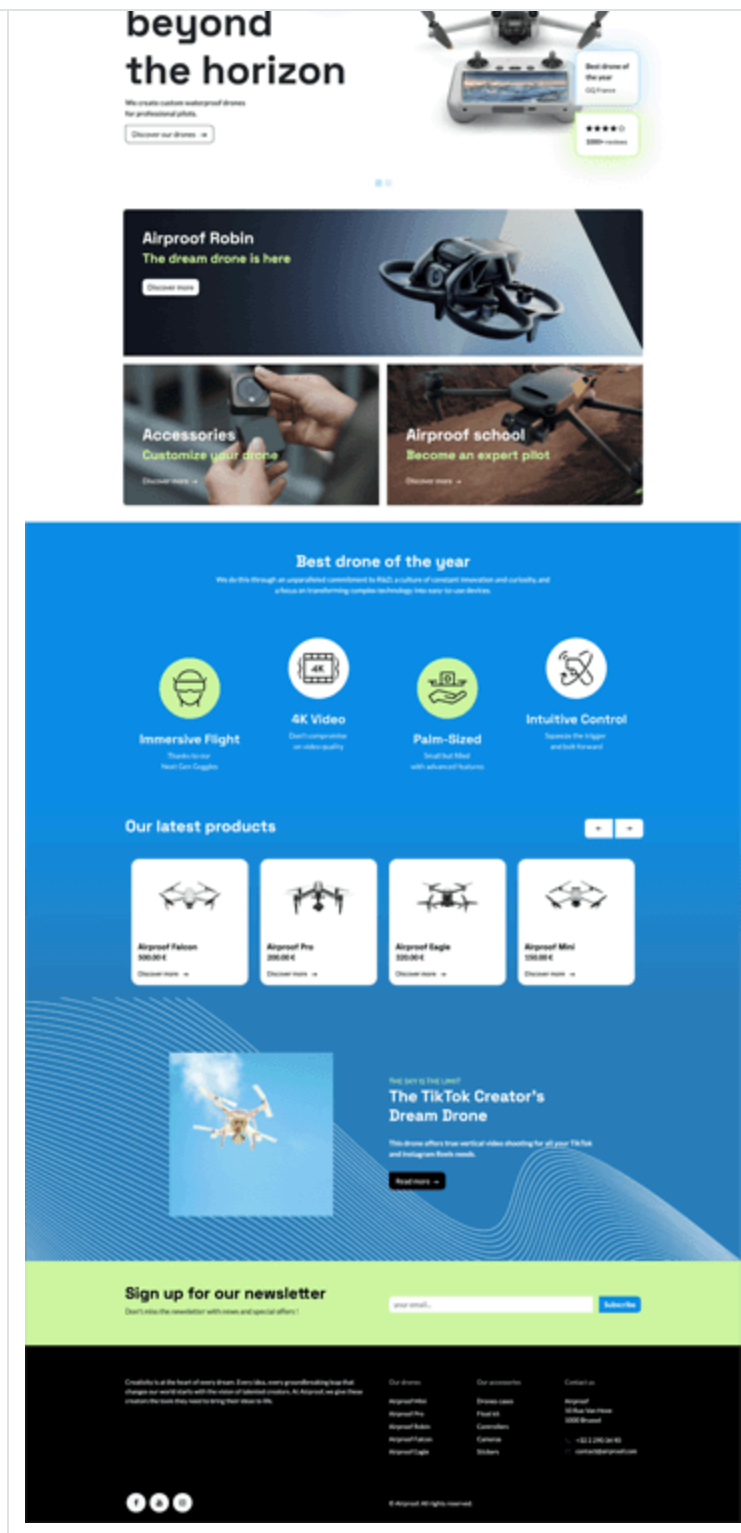

Our client, Airproof, has provided their latest design for their waterproof drone e-commerce, which we'll replicate.

To start, you must have **installed Odoo locally**. You will also need some knowledge in:

- XML
- JavaScript (not mandatory)
- Bootstrap 5.1.3
- SCSS
- QWeb (Odoo's own templating system)
- OWL (JavaScript framework, not mandatory)

Goal

Replicate the Airproof design.

In the `README.md` of the [Airproof module](#), you can find the various Airproof designs that you will replicate throughout the different exercises in this tutorial.

You can also find all the code necessary for creating the Airproof website there. You should also obtain this by the end of the tutorial. It is recommended to try solving the exercises first

Throughout this tutorial, you will find “See also” sections leading to parts of the [How-to guide: Website themes](#) documentation. Be sure to read this documentation thoroughly each time! With it, you will find the solution to every exercise.

Ready? Let’s get started!

Chapter 1 - Theming

Setup

Build your module structure

Declare Odoo variables

Declare Bootstrap variables

Define presets

Chapter 2 - Build your website

Create a page

Add a media

Add building blocks

Navigation

Chapter 3 - Customisation, Part I

Add custom SCSS

Add custom JS

Create a custom header

Create a custom footer

Create your custom building blocks

Create a new dynamic snippets template

[Create a custom background shape](#)

[Create a custom gradient](#)

[Animations](#)

[Forms](#)

[Create a page template](#)

Chapter 5 - Dynamic templates

[Adapt the shop template](#)

[Adapt the product page template](#)

Chapter 6 - Going live

[Translations](#)

[Module import](#)

[Conclusion](#)
